

IN THE CLAIMS

Claims 1-14 (Canceled)

15. (New) A method of mounting an electronic circuit chip together with another planar electric element on a foldable rectangular sheet having wide sides and narrow sides which are not wider than the wide sides, characterized in that the electronic circuit chip is mounted on the foldable rectangular sheet at a position which is not on any of a line passing through positions of one-half of the length of the wide sides and being parallel with the narrow sides, lines passing through positions of one-third or one-fourth of the length of the wide sides and being parallel with the narrow sides, and a line passing through positions of one-half of the narrow sides and being parallel with the wide sides.

16. (New) A method of mounting an electronic circuit chip as set forth in claim 15, characterized in that the sheet has a crease line having a direction, and a rod-like antenna is mounted on the sheet so as to extend in a direction coincident with the direction of the crease line.

17. (New) A method of mounting an electronic circuit chip as set forth in claim 15, characterized in that a rod-like antenna is mounted on the sheet so as to cross at least one of the lines.

18. (New) A foldable rectangular sheet on which an electronic chip is mounted, having wide sides and narrow sides not wider than the wide sides, characterized in that the electronic circuit chip is located at a position which is not on any one of a line passing through positions of one-half of the length of the wide sides and being parallel with the narrow sides, lines passing through positions of one-third or one-fourth of the length of the wide sides and being parallel with the short sides, and a line passing through a position of one-half of the narrow sides and being parallel with the wide sides.

19. (New) A foldable rectangular sheet as set forth in claim 18, characterized in that the sheet has a crease line having a direction, and a rod-like antenna is mounted on the sheet so as to be extended in a direction coincident with the direction of the crease line.

20. (New) A foldable rectangular sheet as set forth in claim 18, characterized in that a rod-like antenna is mounted on the sheet so as to cross at least one of the lines.
